

Q1: What makes your system different?

Answer:

“Traditional systems rely on static rules and human judgment, which can be inconsistent. Our system dynamically analyzes patient symptoms using AI and assigns a real-time risk score, ensuring urgency-based prioritization instead of first-come-first-serve.”

Q2: 30-sec Pitch

“TriageAI is an AI-powered healthcare triage system that uses voice input and NLP to analyze patient symptoms and assign real-time priority scores. It ensures that critical patients are treated first, reducing delays and improving emergency response efficiency.”

Q4: What AI model?

If you haven't built yet, say smartly:

“We are using a hybrid approach — rule-based filtering for critical symptoms and a machine learning model (like logistic regression or decision tree) for risk scoring. Future scope includes deep learning models for better accuracy.”

Q5: Risk scoring logic

“We assign weights to symptoms like chest pain, breathing difficulty, age, and medical history. These are combined into a severity score, which classifies patients into categories like critical, moderate, or low priority.”

Q6: NLP explanation

“We use NLP to extract key symptoms from user speech by converting voice to text and then identifying medical keywords using preprocessing and classification techniques.”

Q9: Wrong prediction (VERY IMPORTANT)

“Our system is a decision-support tool, not a replacement for doctors. Final decisions remain with medical professionals, reducing liability and ensuring safety.”

Q12: Patient lies?

“We reduce this risk by combining symptom input with measurable data like heart rate, history, and repeated questioning patterns.”

Q15: USP

“Our USP is real-time dynamic prioritization using voice-based input, making it fast, accessible, and more accurate than traditional triage systems.”

BONUS:

Say this once:

“We aim to integrate IoT devices like smart wearables in future to improve accuracy with real-time health data.”

◆ BASIC UNDERSTANDING

Q1. What is TriageAI?

Answer:

TriageAI is an AI-based healthcare system that analyzes patient symptoms using voice input and NLP, then assigns a priority level based on severity to ensure critical patients are treated first.

Q2. What problem are you solving?

Answer:

Hospitals often use manual or first-come-first-serve triage, which delays critical cases. Our system ensures urgency-based prioritization to reduce risk and improve efficiency.

Q3. Why is this important?

Answer:

Even small delays in emergencies can be life-threatening. Our system helps reduce such delays and improves patient outcomes.

◆ TECHNICAL QUESTIONS

Q4. What technologies are used?

Answer:

- AI/ML for risk prediction
- NLP for symptom analysis
- Speech-to-text for voice input

- Backend: Python
 - Frontend: Web/App interface
-

Q5. How does your system work?

Answer:

1. Patient gives input via voice/text
 2. Speech converted to text
 3. NLP extracts symptoms
 4. AI model calculates risk score
 5. Patient assigned priority level
 6. Queue updated dynamically
-

Q6. What is risk scoring?

Answer:

Risk scoring assigns a severity value based on symptoms, age, and medical history to classify patients into critical, moderate, or low priority.

Q7. What AI model are you using?

Answer:

We use a hybrid approach combining rule-based logic with machine learning models like decision trees or logistic regression for severity prediction.

Q8. How does NLP work in your system?

Answer:

NLP processes patient input, identifies key symptoms, and converts unstructured text into structured medical data for analysis.

Q9. What dataset are you using?

Answer:

We plan to use publicly available medical datasets and symptom-based datasets, along with synthetic data for initial training.

Q10. How do you handle incorrect input?**Answer:**

We use validation checks, repeated questioning, and fallback options like manual entry to reduce errors.

◆ REAL-WORLD QUESTIONS**Q11. How is your system better than existing ones?****Answer:**

Our system provides real-time dynamic prioritization using AI, unlike traditional static or manual systems.

Q12. Can this replace doctors?**Answer:**

No, it acts as a decision-support tool. Final decisions are always made by doctors.

Q13. What if AI gives wrong results?**Answer:**

Doctors verify all outputs. The system assists, not replaces human judgment, reducing risk.

Q14. How will hospitals trust your system?**Answer:**

Through testing, validation, accuracy reports, and gradual integration with existing hospital systems.

Q15. What about rural areas?**Answer:**

The system can be designed lightweight and offline-compatible for basic functionality.

◆ CRITICAL THINKING**Q16. What if patients lie about symptoms?****Answer:**

We reduce this risk by combining multiple inputs and, in future, integrating real-time health data from devices.

Q17. How is this different from symptom checker apps?**Answer:**

Our system is designed for hospital triage with real-time queue management and prioritization, not just diagnosis.

Q18. What are the limitations?**Answer:**

- Dependency on data quality
 - Initial training accuracy
 - Requires hospital integration
-

◆ INNOVATION & FUTURE**Q19. What is your USP?****Answer:**

Real-time AI-based prioritization using voice input, making triage faster, smarter, and more accessible.

Q20. Future improvements?

Answer:

- Integration with wearable devices
 - More accurate AI models
 - Multi-language support
 - Real-time hospital data integration
-

◆ BONUS (HIGH-IMPACT ANSWER)

Q21. Why should we select your project?

Answer:

Our project solves a real-life critical healthcare problem using AI, improves emergency response time, and has strong scalability and real-world impact.

FINAL TIP

Before presenting:

- Speak slowly
- Don't rush answers
- If stuck, say:
"That's a great question, we are exploring it further as part of our future improvements."
